Re: Treatment of Feline Hyperthyroidism at Saint Francis.

Dear Colleagues,

In recent years our industry has begun refining an exciting cure for a difficult condition: feline hyperthyroidism. Radioactive Iodine Therapy, otherwise known as I-131, offers a lifetime cure for cats suffering from hyperthyroidism in 98% of cases.

The Marshall Center for the Treatment of Feline Hyperthyroidism at Saint Francis offers I-131 therapy via a single oral dose – a pill, instead of an injection. In most cases, the cat can go home four or five days later and look forward to a happy, healthy life free from the disease of hyperthyroidism.

The Marshall Center at Saint Francis is named in honor of Dr. Dan Marshall, who is a pioneer in the oral delivery of I-131 in the United States. It was Dr. Marshall himself who designed the Nuclear Medicine facility at Saint Francis, and he remains a trusted colleague, friend and advisor of our Nuclear Medicine staff.

The Marshall Center staff are specially trained in providing around-the-clock care and comfort for cats under I-131 treatment, including 24/7 supervision by veterinarians and certified nurses.

I-131 saves pet owners time, money and stress because it frees them from the burdens of daily pilling, specialized foods, and invasive options like surgery. But more importantly, I-131 saves the cat a lifetime of daily stress and discomfort.

We invite you to learn more about The Marshall Center at saintfrancis.org, or please don’t hesitate to call us at 856.467.0050.

All our very best!
